

4.6 - Transformations of Exponential Functions

- GOAL – Investigate the effects of transformations on the graphs and equations of exponential functions.

This is the graph of the function $f(x) = 2^x$.

- ❖ It is an increasing function
- ❖ It has a y-intercept of 1
- ❖ Its asymptote is the line $y = 0$

If we go from $f(x) = 2^x$ to $g(x) = af(k(x - d)) + c$, what happens to the size and shape of $f(x)$?

Take a few minutes and fill in the table on the left.

Function	Sketch	Table of Values	Description of Changes of New Graph												
$g(x) = 2^x + 1$		<table border="1"><thead><tr><th>x</th><th>$y = 2^x$</th><th>$y = 2^x + 1$</th></tr></thead><tbody><tr><td>-1</td><td></td><td></td></tr><tr><td>0</td><td></td><td></td></tr><tr><td>1</td><td></td><td></td></tr></tbody></table>	x	$y = 2^x$	$y = 2^x + 1$	-1			0			1			
x	$y = 2^x$	$y = 2^x + 1$

Example #1

- Use transformations to sketch $y = -2(3^{x-4})$. State the domain and range.

3 key points: $(0, 1)$, $(1, 3)$, $(-1, 1/3)$

Asymptote is x-axis: $y = 0$

1. $y = -2(3^x)$:

- ❖ Vertical stretch by factor 2 and
- ❖ Reflection over the x-axis

2. $y = -2(3^{x-4})$:

- ❖ Horizontal shift right 4 units

Example #1 cont'd

- Use transformations to sketch $y = -2(3^{x-4})$. State the domain and range.

Original Function

$$D = \{x \in \mathbb{R}\}$$

$$R = \{y > 0 \mid y \in \mathbb{R}\}$$

Transformed Function

$$D = \{x \in \mathbb{R}\}$$

$$R = \{y < 0 \mid y \in \mathbb{R}\}$$

Example #2

- Compare and contrast the functions defined by $f(x) = 9^x$ and $g(x) = 3^{2x}$.
- ***Use exponent rules***
- $f(x) = 9^x$
- $= (3^2)^x$
- $= 3^{2x}$
- $= g(x)$
- **Therefore, both functions are the same.**

Example #3

- An exponential function with a base of 2 has been stretched vertically by a factor 1.5 and reflected over the y-axis. Its asymptote is the line $y = 2$. Its y-intercept is $(0, 3.5)$. Write an equation of the function and discuss its domain and range.

- We currently have something like this:

- $y = a * 2^{k(x-d)} + c$

- ❖ Stretch vertically by factor 1.5: $a = 1.5$

- ❖ Reflected over the y-axis: x becomes $-x$

- ❖ Asymptote is the line $y = 2$: Horizontal asymptote moved from $y = 0$ to $y = 2$: $c = 2$

- Therefore, $y = 1.5(2^{-x}) + 2$. To check that we have the right equation, just plug in $x = 0$ and confirm that you get $y = 3.5$ as the answer.

$D = \{x \in \mathbb{R}\}$ – DIDN'T CHANGE.
RANGE WAS: $R = \{y > 0 \mid y \in \mathbb{R}\}$
RANGE IS NOW: $R = \{y > 2 \mid y \in \mathbb{R}\}$
