

## 2.2 The Factor Theorem

### Example #1:

a) Use the remainder theorem to determine the remainder when:

$$(x^3 + 2x^2 - x - 2) \text{ is divided by } (x - 1)$$

Let  $P(x) = x^3 + 2x^2 - x - 2$   
 then  $P(1) = 1^3 + 2(1)^2 - 1 - 2 = 0$

So  $x^3 + 2x^2 - x - 2 = (x - 1)(?)$

b) Determine the quotient when:

$$(x^3 + 2x^2 - x - 2) \text{ is divided by } (x - 1)$$

$$\begin{array}{r} x^2 + 3x + 2 \\ x-1 \overline{) x^3 + 2x^2 - x - 2} \\ \underline{x^3 - x^2 \phantom{- x - 2}} \\ 3x^2 - x \phantom{- 2} \\ \underline{3x^2 - 3x \phantom{- 2}} \\ 2x - 2 \\ \underline{2x - 2} \\ 0 \end{array}$$

OR

c) Factor fully:  $x^3 + 2x^2 - x - 2$

$$\begin{aligned} & x^3 + 2x^2 - x - 2 \\ &= (x - 1)(x^2 + 3x + 2) \\ &= (x - 1)(x + 1)(x + 2) \end{aligned}$$

The Factor Theorem is a special case of the Remainder Theorem.

### The Factor Theorem:

iff

If  $(x - b)$  is a factor of the polynomial function  $P(x)$ , if and only if  $P(b) = 0$

Similarly,  $(ax - b)$  is a factor of the polynomial function  $P(x)$  if and only if  $P(\frac{b}{a}) = 0$

Example #2: List the values that could be zeros of the polynomial. Then, factor the polynomial.

$$x^3 + 5x^2 - 2x - 24$$

Possible values

- |          |          |
|----------|----------|
| $\pm 6$  | $\pm 1$  |
| $\pm 4$  | $\pm 2$  |
| $\pm 1$  | $\pm 3$  |
| $\pm 2$  | $\pm 4$  |
| $\pm 3$  | $\pm 6$  |
| $\pm 8$  | $\pm 8$  |
| $\pm 12$ | $\pm 12$ |
| $\pm 24$ | $\pm 24$ |

Let  $f(x) = x^3 + 5x^2 - 2x - 24$

$f(2) = 0$

So  $x - 2$  is a factor

$$\begin{array}{r} x^2 + 7x + 12 \\ x-2 \overline{) x^3 + 5x^2 - 2x - 24} \\ \underline{x^3 - 2x^2 \phantom{- 2x - 24}} \\ 7x^2 - 2x \phantom{- 24} \\ \underline{7x^2 - 14x \phantom{- 24}} \\ 12x - 24 \\ \underline{12x - 24} \\ 0 \end{array}$$

OR

So

$$\begin{aligned} & x^3 + 5x^2 - 2x - 24 \\ &= (x - 2)(x^2 + 7x + 12) \\ &= (x - 2)(x + 4)(x + 3) \end{aligned}$$

Plot1 Plot2 Plot3

$\sqrt{1} \square x^3 + 5x^2 - 2x - 24$
